

Clinical Policy Title:	teriflunomide
Policy Number:	RxA.018
Drug(s) Applied:	Aubagio®
Original Policy Date:	02/07/2020
Last Review Date:	09/14/2021
Line of Business Policy Applies to:	All lines of business

Background

Teriflunomide is a pyrimidine synthesis inhibitor indicated for the treatment of patients with relapsing forms of multiple sclerosis (MS), to include clinically isolated syndrome, relapsing-remitting disease, and active secondary progressive disease, in adults.

Dosing Information

Drug Name	Indication	Dosing Regimen	Maximum Dose
teriflunomide (Aubagio®)	Relapsing MS	7 or 14 mg orally once daily with or without food	14 mg/day

Dosage Forms

- Tablet: 7 mg, 14 mg

Clinical Policy

Provider must submit documentation (such as office chart notes, lab results or other clinical information) supporting that member has met all approval criteria.

I. Initial Approval Criteria

A. Multiple Sclerosis (must meet all):

1. Member has a diagnosis of relapsing-remitting MS, which includes clinically isolated syndrome, relapsing-remitting disease, and active secondary progressive disease;
2. Prescribed by or in consultation with a neurologist;
3. Member is 18 years of age or older;
4. Teriflunomide is not prescribed concurrently with other disease modifying therapies for MS (see *Appendix D*);
5. At the time of request, member is not receiving leflunomide;
6. Dose does not exceed 14 mg (1 tablet) per day.

Approval Duration

Commercial: 12 months

Medicaid: 12 months

This clinical policy has been developed to authorize, modify, or determine coverage for individuals with similar conditions. Specific care and treatment may vary depending on individual need and benefits covered by the plan. This policy is not intended to dictate to providers how to practice medicine, nor does it constitute a contract or guarantee regarding payment or results. This document may contain prescription brand name drugs that are trademarks of pharmaceutical manufacturers that are not affiliated with RxAdvance.

II. Continued Therapy Approval

A. Multiple Sclerosis (must meet all):

1. Member is currently receiving medication that has been authorized by RxAdvance or member has previously met initial approval criteria listed in this policy;
2. Member is responding positively to therapy (e.g., reduction in MS relapse rate);
3. Teriflunomide is not prescribed concurrently with other disease modifying therapies for MS (*see Appendix D*);
4. If request is for a dose increase, new dose does not exceed 14 mg (1 tablet) per day.

Approval Duration

Commercial: 12 months

Medicaid: 12 months

III. Appendices

APPENDIX A: Abbreviation/Acronym Key

FDA: Food and Drug Administration

MS: Multiple Sclerosis

APPENDIX B: Therapeutic Alternatives

Not applicable

APPENDIX C: Contraindications/Boxed Warnings

- Contraindication(s):
 - Severe hepatic impairment;
 - Pregnancy or females of reproductive potential not using effective contraception;
 - Hypersensitivity to teriflunomide, leflunomide or any inactive ingredients in teriflunomide; and
 - Coadministration with leflunomide.
- Boxed Warning(s):
 - Hepatotoxicity: Clinically significant and potentially life-threatening liver injury, including acute liver failure requiring transplant, has been reported. Concomitant use of teriflunomide with other hepatotoxic drugs may increase the risk of severe liver injury. Obtain transaminase and bilirubin levels within 6 months before initiation of teriflunomide and monitor ALT levels at least monthly for six months. If drug induced liver injury is suspected, discontinue teriflunomide and start accelerated elimination procedure.
 - Embryofetal toxicity: Teratogenicity and embryolethality occurred in animals administered teriflunomide. Exclude pregnancy prior to initiating teriflunomide therapy. Advise use of effective contraception in females of reproductive potential during treatment and during an accelerated drug elimination procedure. Stop teriflunomide and use an accelerated drug elimination procedure if the patient becomes pregnant.

APPENDIX D: General Information

- Teriflunomide is the principal active metabolite of leflunomide and is responsible for leflunomide's activity in vivo. At recommended doses, teriflunomide and leflunomide result in a similar range of plasma concentrations of teriflunomide.
- Disease-modifying therapies for MS include:
 - Infusion therapies
 - natalizumab (Tysabri®)

- mitoxantrone (Novantrone®)
- ocrelizumab (Ocrevus™)
- alemtuzumab (Lemtrada®)
- rituximab (Rituxan®) (off-label)
- Injectable therapies
 - glatiramer (Copaxone®, Glatopa®)
 - interferon beta-1a (Avonex®, Rebif®)
 - interferon beta-1b (Betaseron®, Extavia®)
 - ofatumumab (Kesimpta®)
 - peginterferon beta-1a (Plegridy®)
- Oral therapies
 - cladribine (Mavenclad®)
 - dalfampridine (Ampyra®)
 - dimethyl fumarate (Tecfidera®)
 - diroximel fumarate (Vumerity®)
 - fingolimod (Gilenya™)
 - monomethyl fumarate (Bafiertam™)
 - ozanimod (Zeposia®)
 - siponimod (Mayzent®)
 - teriflunomide (Aubagio®)
